

Design of a 60° x 40° Augmented Reality (AR) near to eye display.

- Customer initial requirements
- The requirement “negotiation” process
- Choice of architecture
- The design process- considerations ; issues encountered ; performance
- Non sequential design
- Interface with the mechanical designers
- Performance

What does everyone want? (2013 presentation)

Oakley Thump = Sunglasses+MP3

“Oakley look” .	i.e., thin & small optics
Augmented imaging	preferably an optical see-through channel
Low cost	& small image generators (OLED, LCOS, ...)
Wide field of view	30° deg to 110° full diagonal field
Large eye box	~10 mm diameter, for eyeball movement + loose alignment
Large eye relief	> 20 mm, for lash clearance and prescription glasses
High resolution	~ SXGA (1280 x 1024) or higher
Low distortion	< 2%
Bright	hundreds of Cd/m ²
Artifact free;	no “dirty windows” ; no raster; no sunlight scattering
Low weight	
Other:	eye tracking; battery life; connectivity....

NEDs: categories of optical design forms (2013)

- Magnifiers i.e. eye piece + image generator
- Relay based NEDs
- Monocentric system
- “Pancake” designs : on axis folded by polarization means
- Pupil splitting :
- Segmented (or tiled) NEDs:
- Other: Foveated; Fiber scanning; Retina scanners; etc.

The core of the design difficulty

The powered combiner such an ellipsoid can easily relay the **pupils centers** when their centers are at the ellipsoid foci. However, it cannot by itself **maintain the beam collimation** at its power changes over the field and the large off axis aberrations have to be corrected by the remaining optics.

Pilot training HMD using symmetrical elements

The designs are based on the “Nodal Theory” by Thompson and Shack which shows that the aberrations of the tilted combiner can be compensated by a system using tilted symmetrical components which does not result in new aberrations, but just adds new field dependencies.

Eye Relief > 50 mm
Eye Box 15 mm
FOV 65 deg H, 60 deg V
SXGA

Usually not a see through

SXGA
60° FOV
10mm Eye box
24 mm Eye Relief

Main problem : efficiency ~ 6%

Kessler Optics & Photonics Solutions, Ltd.

www.kessleroptics.com

Pupil splitting designs

(also: pupil expanders and dilated optics)

We want an optical system to project into the eye with :

- * Low F/number (= high Numerical Aperture) for efficiency
- * large eye box
- * Short focal length for large field and small optics

$$\begin{aligned} \text{NA} &= \sin(\theta) \\ (\text{Eye Box}) &= 2 * f * \text{NA} \\ \text{FOV} &= S / f \end{aligned}$$

However , short focal length means small eye box, so we use a short focal length and get a small exit pupil and then expand it by replication to fill the eye box.

Conservation laws and invariants

$$\text{Etendue} = A \Omega$$

■ A = area

■ Ω = projected solid angle = $\pi * (\text{NA})^2$

$$\text{Also: } P = B * A * \Omega ,$$

where P = power ,in lumens or Watts

B = luminance in Cd/m^2 or Nits

The three conservation laws (when there is no pupil expansion or diffusion)

$$P' = P$$

energy conservation

$$A' \Omega' = A \Omega$$

Etendue invariance,

$$B' = B$$

Brightness theorem

When we diffuse at the image or expand the pupil:

$$P' = P$$

energy conservation

$$A' \Omega' > A \Omega$$

Etendue is **increased**

$$A' > A \text{ for pupil splitting}$$

$$\Omega' > \Omega \text{ diffusion at an intermediate image}$$

$$B' < B$$

Brightness **decreased**

Propensity for artifacts have to be considered in designs: The “Dirty windshield” artifact

Sunlight scattered off structures and discontinuities on the windshield
This artifact is present in a number of systems with or without windshields.

Correcting for shimmering

See-through: SXGA; 50 degrees diagonal; 10 mm Eye Box ;23mm Eye Relief; 0.78" OLED

Kessler and Bablani , USA 8094377

Two ways to design for low shimmering system:

1. to optimize use the full eye box- may be an overkill since the eye is a sub aperture of the eye box at any given position.
2. To use multi configurations for the sub apertures at different location within the eyebox and include chief ray deviations in the merit function.

SPECKLE

$C=0.0$

$C=0.04$

Speckle noise with mean 0 and variance 0.01

$C=0.5$

Speckle noise with mean 0 and variance 0.1

$C=0.84$

Speckle noise with mean 0 and variance 1

modules

Optics &

www.kessleroptics.com

Color artifacts: Latest shoot out between Lumus Maximus and Hololens II

↑ Hololens 2 $43^\circ \times 29^\circ$ (Diagonal $\sim 52^\circ$)

← Lumus Maximus $35.4^\circ \times 35.4^\circ$ (Diagonal $\sim 50^\circ$)

Same Lens (17mm) and Camera (Olympus M5 Mark III) with no scaling

From Karl Gutttag blog- there are differences in resolution and other attributes but the color artifacts are very present with the Hololens II

Kessler Optics & Photonics Solutions, Ltd.

Zemax Event 6_9_2021 13

A specific recent AR design: Customer original requirements

90 degrees H field obtained by three of the above “blended” by 50 degrees V so each is 30H x 50V

Back to the customer at hand and his requirements:

The main specifications for this design are:

1. The field of view of 60 degrees by 40 degrees (70 deg diagonal)
2. The eyebox of 10 mm diameter
3. Eye relief (from the eye to the closest part of the splitter) > 20 mm
4. Resolution – need to resolve the 7.2 pixels of the OLED*.
5. Maximize brightness in NITS
6. No obscuration of the see through except for looking above the 40 degrees field.
7. Reduced components complexity (no free-forms at least initially) to allow relatively short build.
8. Reasonable esthetics

*OLED image generator is 2560 x 2560 pixels with 3000 NITS

Configuration I

This is a “Bird Bath” design with a relay

The center of curvature of the mirror is at the eyebox

So there are no off axis aberrations from the mirror and its spherical aberration is corrected at the accessible eyebox conjugate with an aspheric

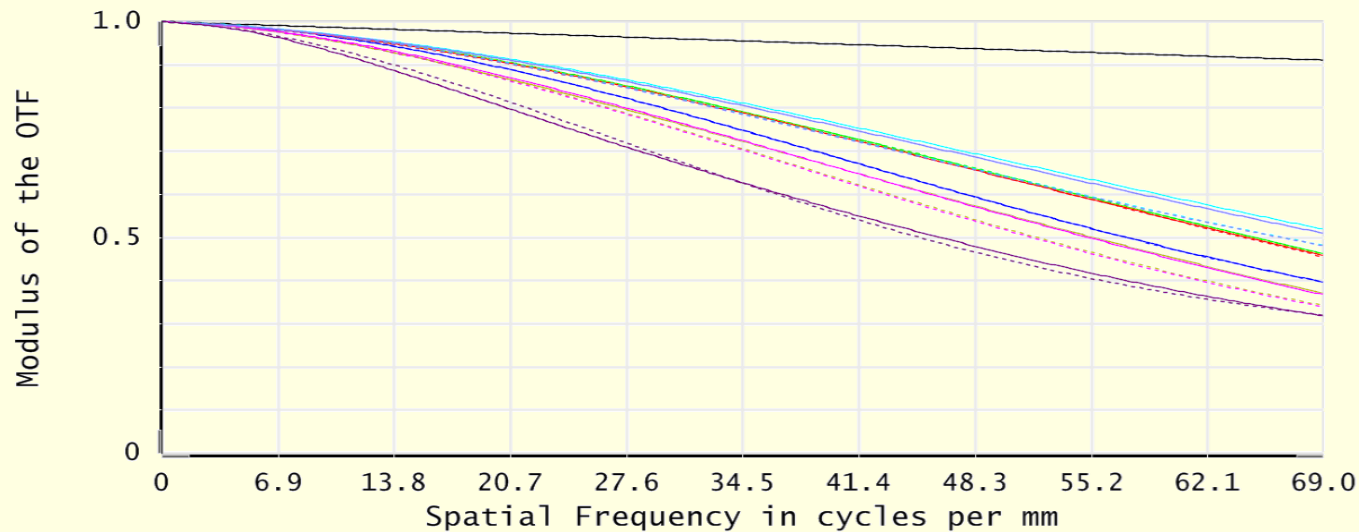

Components:

- 1. Spherical polycarbonate combiner
- 2. S-BSL7 or similar, splitter (silvered mirror or PBS namely wire grid splitter)
- 3. S-NPH2 aspheric singlet
- 4. S-LAH53 aspheric singlet
- 5. S-NPH2/S-LAH53 doublet
- 6. S-BSM4 right angle prism
- 7. S-LAH57 singlet
- 8 IF PBS is used than also: a QWP and a polarizer

Performance- Monochromatic

On merit functions

We usually start with RMS spots

We really usually want good MTFs

RMS spot are related to the slope of the MTF curves at MTF origin

As we get closer we switch commonly to wavefront to get better MTFS. This is because the Strehl Ratio is representing the volume under the OTF surface and the Strehl Ratio for a corrected system is related to the wavefront variance through the Marechal relation.

But: if the system final system SR is not going to be better than about .8 then the Marechal relation may not hold and using the wavefront may not result in improved MTFs so we may have to add say some MTF operands or just use the SR operand.

Non-sequential model

Configuration I: where the relay is folded sideways

Well- the customer likes the performance but not the size/look.

Converting Sequential to non Sequential on Zemax

- Generally, the conversion is easy either by using the Zemax utility “convert to NSC group”
- How to model wire grid polarizer in NS?
- How to curve a Jones element?
- How to convert Q polynomials to NS

Modeling of a wire grid polarizer on Zemax

How do I model the wire grid splitter on Zemax?

1.DBEP is not good as the manual says at my plus minus 30 degrees in x or more in skew

2.The usual S and P definition do not work either since S and P are local coordinates for a specific incident angle and the wire grid works on the global x and y coordinates

3.Lumerical and the **Zemax_interoperability_metalens_initial.lsf**

I don't design meta lenses or wire grids . I buy and use them and have their specification say from Moxtek. I want to plug the specifications as I do with coating tables when I get a coating specs. When I design Wire Grid polarizers I happen to use GSOLVER not Lumerical

4. My solution: verify the NS design with a lab set up

Sol-Grid Nano-Structure

Shown here on the *concave* surface of a lens substrate with both Polarization (green) and Anti-Reflective layers (black).

Electron Micrograph images of actual Nano Grid Structures

Breadboard

Cylindrically curving the Jones quarter wave plate

Using a ring array of Jones plates

Q aspherics on non sequential model

- * The latest update has added Q-Surface not a lens though
- * Use the aspheric tool in sequential to convert from the sequential Q to the standard
- * Use these coefficients with the even aspheric lens object.
- * If more then 16 coefficients are needed - use the Odd Extended Aspheric Lens and kill the odd terms.

Interfacing with the mechanical designers

- I am not currently using the LensMechanix on Zemax- I am a bit more old fashioned and create the STP or IGES files and send to the mechanical designers and then import their designs in my non sequential and look for say ghosts

Initial Mechanical design for the relay

Configuration II: where the relay is folded up- the prism is smaller

Eyebox

Object 1 m away

Configuration 3 of 3

Config III Non-Sequential model

Good performance and good forehead clearance

Kessler Optics & Photonics Solutions, Ltd.
www.kessleroptics.com

Pugh chart

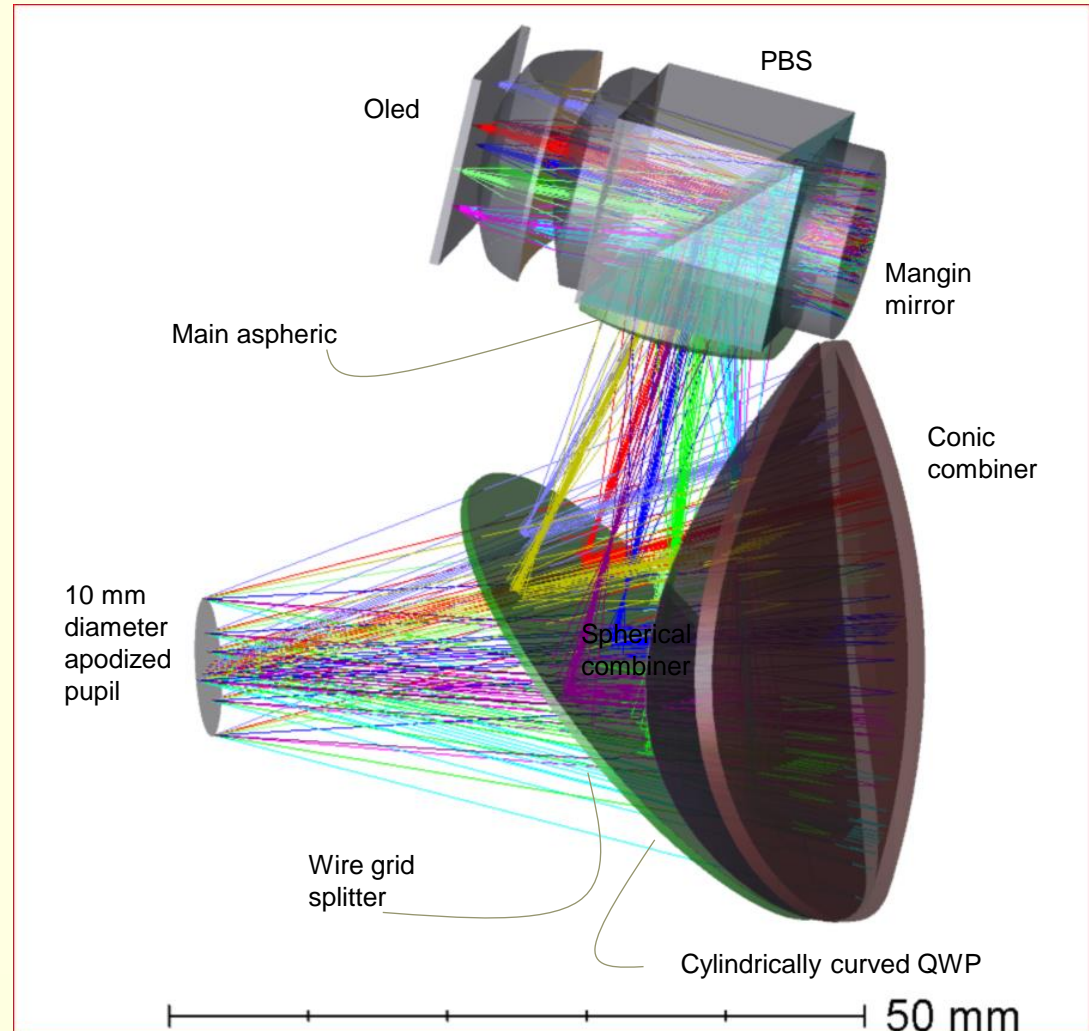

Configuration:	I	II	III
description	Shown before- using a X fold refractive relay	Using a Y fold refractive relay	Using a reflective Y fold +PBS relay
field	$60^0 \times 40^0$	$60^0 \times 36^0$	$60^0 \times 36^0$
size	large	medium	compact
concerns	large	Forehead clearance 10 pix lateral color	A bit more risky due to PBS
Brightness	1	1	~.8

Configuration IV- improving on Conf.III

Pupil is modeled not by floating sub apertures but gaussian apodised 10 mm eyebox
Combiner is conic

PBS has a bit higher risk- it is Confit quite fast and may present delays in purchasing. Also- maybe about 20% brightness cost

Configuration V: back to right angle prism and Y fold – can the forehead clearance be improved compared to config II?

Compared to II- the combiner is conic, the eyebox is 10 mm diameter , gaussian apodization
Clearance increased by also tilting the system 6 degrees forward (pantoscopic tilt)

We also achieve low distortion and lateral color correction

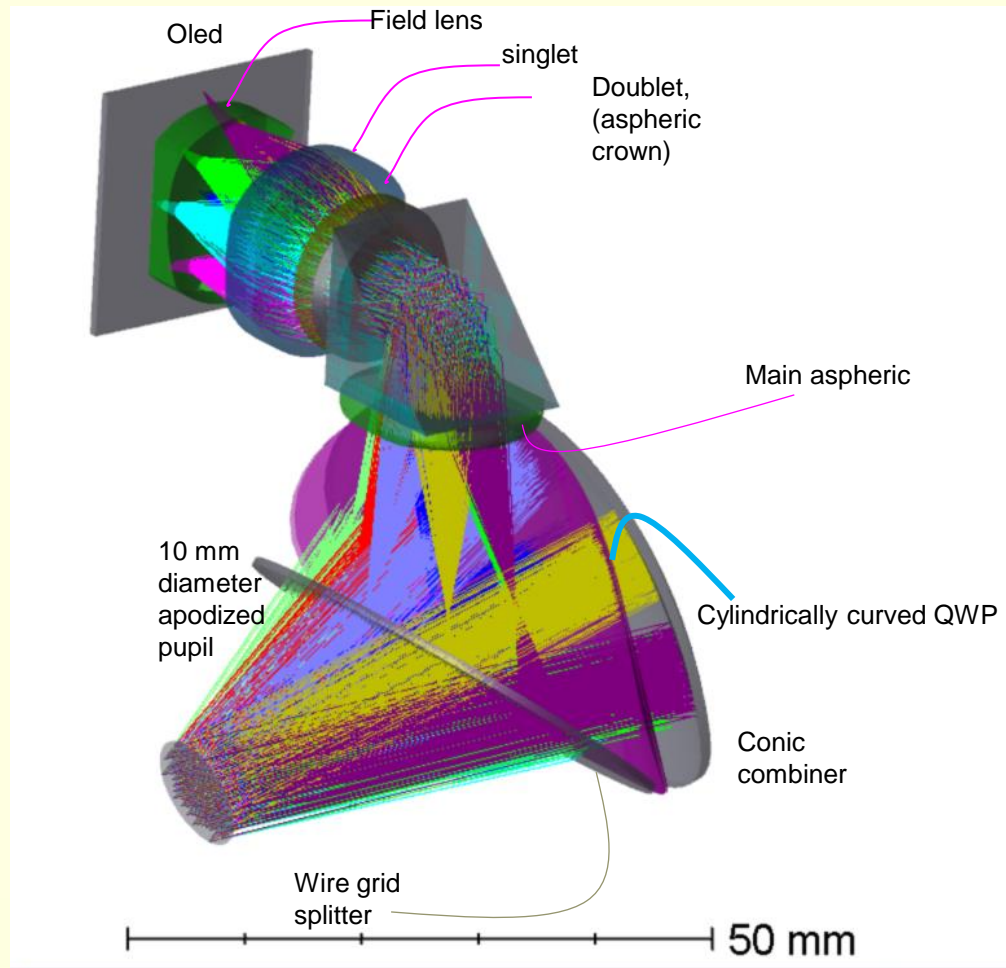

Conf. V non sequential

Question: should we do this for the low risk and later come back to the reflective relay? Well- customer really wants x fold with the size of a Y fold.

Configuration VI X fold

10 mm gaussian
apodised eyebox,
Conic combiner
Stop moves to the prism
hypotenuse to make the
prism smaller.

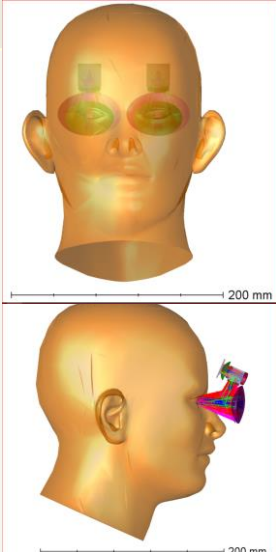

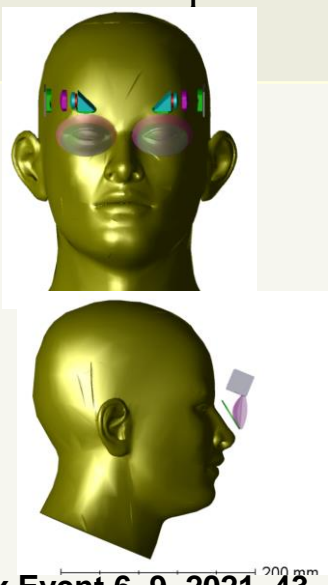

System height is good and no forehead clearance issues

Pugh chart Cont.

Design FREEZE

Configuration:	IV	V	VI
description	Like III +conic combiner ; Y fold; apodized pupil; polarization elements & cements ; smaller folding prism	Like II + conic combiner; Y fold; apodized pupil; polarization elements and cements No need for lateral color and distortion correction	Like I, compacted, X fold conic combiner, polarization &cements ; Eye relief 17 mm to top of splitter Lateral color and distortion corrected
field	60° x 36°	60° x 36°	60° x 36°
size	compact	compact	compact
concerns	PBS elevated risk	Forehead clearance	-
Brightness	.8 on axis, some fall off	1	1
			

Performance : MTFs (10 mm apodized pupil)

Field sizes are for an object at 1000 mm away

Shootout with Hololens II
